Business Analytics M.S. candidate with experience translating operational data into decision-ready KPIs, dashboards, and recurring reports using SQL, Python, Tableau, and Excel. Passionate about solving problems through data-driven approaches, leveraging technical skills and AI-assisted workflows to develop practical solutions.

## Professional Experience

### Data Analyst & Lead Instructor

Mathnasium | San Francisco, CA | August 2024 – Present

- Built a reporting workflow on multiple tables and metrics using Python, PostgreSQL, and dbt, producing standardized KPIs and visualizations that surfaced performance gaps across 5–10 topics and dozens of students, enabling center management to adjust instructional approaches, communicate findings to parents, and adapt curriculum content.
- Implemented Copilot into workflows for selecting instructional content, supported and maintained existing workflows for tracking individual students' curricula and progress, and made decisions about instructional content and course progression.

### Logistics Associate

MedGenome, Inc. | Foster City, CA | June 2021 – June 2022

- Extracted and analyzed LIMS data in Excel to track project duration and client distribution, communicating findings through scheduled presentations and in response to ad-hoc requests; analyzed project lifecycle data to optimize sample archiving timing, increasing storage efficiency by ~10%.
- Served as a liaison among clients, research teams, and operations; coordinated cross-functional workflows, maintained compliance logs, tracked samples and supplies, and supported timely project completion and data delivery.

## Projects

### Retail Rocket ELT Pipeline and Data Warehouse

Tools: Python (PySpark, pytest), PostgreSQL, dbt/MetricFlow, Lightdash, Docker

- Built a containerized ELT pipeline for 23M+ rows of e-commerce data, using PySpark, PostgreSQL, and dbt to create a BI-ready galaxy schema for reporting and self-service analysis; implemented ingestion validation, pytest coverage, and dbt model tests to ensure data reliability.
- Derived 1.76M visitor sessions using 30-minute inactivity logic and resolved category hierarchies with recursive SQL; defined governed conversion and engagement metrics in MetricFlow, and used Lightdash to identify session duration as a revenue lever, modeling a scenario yielding a ~5% increase in MRR.

### Bay Wheels Operational Data Analysis

Tools: Python (pandas), Parquet, Tableau, Jupyter

- Analyzed and validated 10.6M bike-share trips from 30 monthly CSVs using pandas, producing a cleaned Parquet dataset and four reusable summary tables to evaluate station rebalancing, hourly demand, rider segments, and growth trends.
- Built a Tableau dashboard and executive summary that identified two stations with approximately 1,000+ net trip outflows and two with approximately 600 net inflows, compared member-versus-casual demand by location and time, and recommended targeted bike redistribution.

## Education

**M.S. Business Analytics** - San Francisco State University | San Francisco, CA | August 2024 - December 2026 (Expected)

**B.S. Mathematics** - University of California, Santa Cruz | Santa Cruz, CA | June 2022 – August 2024

**A.T. Economics** - Cañada College | Redwood City, CA | June 2020 – June 2022

## Technical Skills

**Languages & Databases:** SQL, Python, PostgreSQL

**Analytics & BI:** Excel, Tableau, pandas, Jupyter, Lightdash

**Data Engineering:** dbt, PySpark, ETL/ELT, dimensional modeling

**Tools:** Git/GitHub, Docker, Airflow
